Professional Summary

Backend Software Engineer with 2 years of experience building scalable, real-time systems in Python. Skilled in FastAPI, Django, and PostgreSQL, with hands-on experience integrating LLMs (RAG, Anthropic Claude) and deploying services on AWS and GCP. Strong focus on API design and production debugging.

Skills

- **Languages:** Python, Java
- **Frameworks:** FastAPI, Django, Django REST Framework, Bottle
- **Generative AI:** LLM Integration, RAG, Anthropic Claude, Prompt Engineering
- **Databases:** PostgreSQL, InfluxDB
- **Cloud & Tools:** AWS, GCP (Cloud Run), Docker, Linux, Gunicorn, Uvicorn, Git, GitHub, Bitbucket, Jira, Postman, VS Code, OCR
- **Architecture & Practices:** REST APIs, Microservices, Server-Sent Events (SSE), WebSockets, Pytest, SDLC, STLC
- **Soft Skills:** Cross-functional Team Collaboration, Adaptability, Analytical Problem Solving

Experience

Software Engineer — Trinesis Technologies Pvt Ltd. — August 2024 - Present

- Designed and developed backend systems for dashboards supporting operational data visualization
- Designed PostgreSQL database architecture for efficient data storage and retrieval with optimized query performance
- Developed Django REST Framework APIs with routing, views, and serializers for seamless system integration
- Practiced unit testing and debugging to ensure code reliability and adherence to requirements
- Collaborated with cross-functional teams using Django MVT architecture to design scalable systems
- Solved critical performance bottlenecks by implementing connection pooling and query optimization

Projects

DRIMS (Digital Record Information Management System):

- Developed two new Python backend services and enhanced existing ones by resolving critical bugs, adding features, and improving overall platform performance
- Replaced the default Bottle development server with Gunicorn for selected services, enabling concurrent request handling and reducing container downtime
- Reduced peak memory of the TIFF-to-PDF conversion service by roughly 93% (3.8 GB to 250 MB) and output PDF size by 90% (76 MB to 8 MB) by replacing Pillow with img2pdf, eliminating memory-related request failures
- Diagnosed and fixed a production bug where memory exhaustion blocked database-entry creation, causing a batch daemon to repeatedly re-upload the same files, stopping duplicate AWS Batch jobs and stabilizing the pipeline
- Deployed, monitored, and troubleshooted cloud-hosted services on AWS, improving stability and scalability

FLUXJIVA:

- Built backend services for FLUXJIVA, an on-machine application for real-time monitoring of live machine data with an integrated AI assistant
- Developed the core chat service in FastAPI with RAG over both company knowledge and live machine data, invoking Anthropic Claude Sonnet to answer user queries, deployed on GCP Cloud Run
- Migrated real-time communication from WebSockets to Server-Sent Events (SSE), eliminating connection timeouts under heavy data load and streaming live measurement data to many concurrent clients with minimal overhead
- Cut InfluxDB CPU utilization from over 90% to a 20–40% average by adding a caching layer for OEE (Overall Equipment Effectiveness) calculations, reusing results across client connections and eliminating request failures under load
- Built secure user authentication and token management using Django's auth system

Education

Parul Institute of Technology, Parul University, Vadodara, India

2019 - 2023

- Bachelor of Technology (B.Tech) in Computer Science Engineering
